Court Surface Options

Synthetic Grass Surfaces

At All Sport Projects, we build tennis courts using a wide range of different surfaces. Our recommendation for families would be a synthetic grass sports surface, providing softer landings and much longer wear in Queensland's tough conditions.

Depending on the sport there are numerous synthetic Grass options, each with a different texture / colours and Fibre length. For some sports you need to fully glue down the grass to the slab, where as with others it is sat on the slab, and only glued at the joins and then topped with sand. Synthetic Grass can be laid over a multitude of court bases from Concrete / Road Base or Asphalt, it offers a Softer underfoot option, than a Hardcourt. It is the ideal surface to use when upgrading old courts [concrete & Roadbase etc] with cracks and wear and tear. There is generally a 7 year Product Warranty on Syn Grass, but you would generally get a far longer life span of up to 20 years.

Acrylic Hard Courts

A Hardcourt generally refers to a concrete court with an Acrylic Surface Coating[s]. A Hardcourt would generally be the most versatile court with families for all round use, such as kids playing on the court/riding bikes/playing cricket etc:

Additional lines [multisport] can easily be added for other sports in various colours.

They do not require a great deal of maintenance and can be easily cleaned with a pressure cleaner. There is generally a 5 year product Warranty on an Acrylic Surface.

Hard Court Gallery

Polypropylene Surfaces

Cricket grass is top of the range and offers a 5 year warranty.

This product is environmentally friendly, in that its yarns are heavy metal free. A low pile height of 9mm makes this product ideal for high traffic areas and it's specifically made for cricket, with grass yarns that are woven with polypropylene to stop them from breaking or getting ripped.

Cricket pitches that are protected by cricket grass are safer, more even and reliable. It's less likely to cause injury and is durable.

Sports Court Bases

Your Court Base Can Be Tailored To Suit Your Specific Needs, Whether Residential Or Commercial.

Court Base Options

Choosing the right base to suit your specific needs is an important part of the court design process.

We will help you choose the right base, and ensure your base is installed perfectly in a suitable fashion for use with a sports court. Unlike regular concreting companies, our team have extensive experience laying bases that are specifically designed for use in high quality, long lasting sporting court applications.

Roadbase

- Softest to play on
- Affordable best value for money
- Easy to repair

Concrete

- Fastest build time
- Hardest, longest lasting base
- Most commonly used

Asphalt

- Softer playing than concrete
- Low cost & easy to install
- Install subject to soil conditions

Roadbase

All our Roadbase Courts are fully engineered & designed to suit conditions throughout Australia, giving you peace of mind when choosing it as your base.

The main reason Roadbase isn't every court builders' choice, is because it is not the easiest to install. Many other builders struggle with the installation of roadbase. Over 35 years we have significant experience installing this base, giving you a softer playing surface and less stress on your body.

For both residential and commercial projects, Roadbase is also very easy to repair, and the most cost effective to fix should damage occur to your court.

Concrete

Concrete bases are the most popular for a range of outdoor sporting courts in Australia. They are fast and easy to install, and are very long lasting and hard wearing.

They're the most popular type of base for sports courts in Australia and offer great value (affordability; longevity; reliability; durability.)

With such a hard surface they offer predictable play, although are less forgiving than the softer Roadbase alternative. Your concrete court will be durable and last for approximately 25 years.

Asphalt / Bitumen

Asphalt offers a soft and flexible playing experience, and is easy to maintain. All Sport Projects has experience designing asphalt bases using premium grade materials, with appropriate drainage to ensure a stable surface for a longer lasting court with minimal maintenance.

Asphalt is a cost efficient court surfacing solution for sports facilities, homes, parks and schools.
